As a future computer engineer, I submit this application, since I see myself with enough capacities to approach a project of such caliber thanks to my learning in other jobs, in which I have obtained outstanding qualification, due to my huge commitment made in these.

Prior to this project I have done several works of similar language and application. The most important have been:

- GamUS Four, Web application of video game information in which we find trailers, prices, and recommendations of them, as well as being able to comment on Twitter and Blogger. All this thanks to the use of Java 7, JavaScript, CSS, Oauth 1 and Oauth 2 in a period of 3 months.
- Tecnovial, application of database management for a company dedicated to the driving school, with which you can manage all the movements of the same one, enroll a student, to point it to an examination or to carry the timetable of the class. All implemented with PHP, CSS, HTML, SQL and JavaScript in a period of 6 months.

I studied primary at the school Hermelinda Nuñez, and the ESO and the A levels of technology, in the I.E.S Albero, located in Alcalá de Guadaira, where I got excellent qualifications which allowed me to access the university career of computer engineering.

The programming languages I know, and I've worked with are Java, JavaScript, SQL, HTML, CSS, PHP, brief knowledge about Python and C++. On the other hand, I have also worked with the game engine Unity.

Use of the main language Spanish and I have a medium level of English, not certified.
