As student of third-year of Computer Engineering Software, I possess the capacities and attitudes necessary to participate in this project of such magnitude. The last course I did two big projects, both of which are qualified with outstanding. One of them related to a company, which guarantees my commitment and dedication when it comes to doing a job.

Previously, I performed two projects in group: GamUS Four and Tecnovial.

1. GamUS Four (https://gamus-four.appspot.com/) is a Web application of information about video games in which trailers and prices of the same are provided, while using the technology Oauth 2 and Oauth 1 to publish content on social networks like Blogger and Twitter. Java 7, JavaScript and high knowledge about CSS were used to perform this project in a period of three months.

2. Tecnovial is a database management application, in our case, of a driving school. It performs all kinds of daily actions such as registering a student, enrolling it for a test or take control of the company's cars and class schedules. All this was done in a period of six months with a base of PHP, JavaScript, HTML, CSS and SQL.

I studied primary in the C.E.I.P. Guadalquivir and the E.S.O. in the I.E.S. Antonio de Ulloa, where I obtained honors in all the courses. I carried out the technological A levels in the I.E.S. San José, where I finished my previous studies to the university with honors. In 2016 I agreed to the University of Seville and began my Computer engineering studies of Software.

I have extensive knowledge about Java, JavaScript, SQL, HTML, CSS, PHP, and a brief base on Python and C++. Furthermore, I have dealt briefly with the Unity video game engine and with design programs like Photoshop CS. I usually communicate in my mother tongue, Spanish, but I have a basic knowledge of English, B1 certified.
